

# Broadcast自动扩展

---

主讲人：龙良曲

# Broadcasting

- Expand
- without copying data

# Key idea

- Insert 1 dim ahead
  - Expand dims with size 1 to same size
  - Feature maps: [4, 32, 14, 14]
  - Bias: [32, 1, 1] => [1, 32, 1, 1] => [4, 32, 14, 14]
-

# Why broadcasting

- 1. for actual demanding
    - [class, students, scores]
    - Add bias for every students: +5 score
    - [4, 32, 8] + [4, 32, 8]
    - [4, 32, 8] + [5.0]
  - 2. memory consumption
    - [4, 32, 8] => 1024
    - [5.0] => 1
-

# Is it broadcasting-able?

- Match from **Last** dim!
    - If current dim=1, expand to same
    - If either has no dim, insert one dim and expand to same
    - otherwise, NOT broadcasting-able
-

## Situation 1:

- $[4, 32, 14, 14]$
- $[1, 32, 1, 1] \Rightarrow [4, 32, 14, 14]$

## Situation 2

- $[4, 32, 14, 14]$
  - $[14, 14] \Rightarrow [1, 1, 14, 14] \Rightarrow [4, 32, 14, 14]$
-

# Situation 3

- [4, 32, 14, 14]
  - [2, 32, 14, 14]
    - Dim 0 has dim, can NOT insert and expand to same
    - Dim 0 has distinct dim, NOT size 1
    - NOT broadcasting-able
-

# How to understand this behavior?

- When it has no dim
  - treat it as all own the same
  - $[class, student, scores] + [scores]$
- When it has dim of size 1
  - Treat it shared by all
  - $[class, student, scores] + [student, 1]$

# It's effective and critically, intuitive

- $[4, 3, 32, 32]$

- $+ [32, 32]$

- $+ [3, 1, 1]$

- $+ [1, 1, 1, 1]$

---

**Thank You.**
